Shell Scripting

and

Regular Expressions

CS 35L

Spring 2018 - Lab 3

Logistics

New Office Hours (For Me):

Monday 11:30AM - 1:30PM

Boelter 2432

Posted on CCLE

Or try Email/Piazza!

Lab setup - *Locale* for Assignment 2

- Please set your Locale:
  - `export LC_ALL='C'`

- Important because we want the ‘sort’ shell command to be ASCII character complainant
  - Otherwise your output for ‘sort’ is unknown and not deterministic, and your assignment results will not be as expected

Regular Expressions

Basic I/O Redirection

- Most programs read from stdin
- Write to stdout
- Send error messages to stderr

```
$ cat                          With no arguments, read standard
                               input, write standard output
now is the time                Typed by the user
now is the time                Echoed back by cat
for all good men
for all good men
to come to the aid of their country
to come to the aid of their country
^D                    Ctrl-D, End of file
```

Redirection and Pipelines

- Use *program* < *file* to make *program*'s standard input be *file*:

```
cat < file.txt
```

- Use *program* > *file* to make *program*'s standard output be *file*:

```
cat < file.txt > file2.txt
```

- Use *program* >> *file* to send *program*'s standard output to the end of *file*.
- Use *program1* | *program2* to make the standard output of *program1* become the standard input of *program2*.

```
cat assign2.html | tr -c 'A-Za-z' '[\n*]'
```

Sorting words

- Investigate the ‘sort’ command
- man sort
- sort all the words in
  - /usr/share/dict/words
- save to your home folder
- sort [option] /usr/share/dict/words …?
- `sort -d /usr/share/dict/words  > words`
- What does > do???

The tr command (2)

- First, download assign2.html
  - `wget http://web.cs.ucla.edu/classes/spring18/cs35L/assign/assign2.html`
- `cat assign2.html | tr -c 'A-Za-z' '[\n*]'`
- Question: What does tr do?
  - Filters everything except characters from A to Z **and** from a to z
  - 'A-Za-z' is a regular expression

Searching for Text

- grep: Uses basic regular expressions (BRE)
- egrep: Grep that uses extended regular expressions (ERE)
  - grep -E
  - egrep
  - sed -r
- Fgrep: grep matching fixed strings instead of BRE or ERE.
  - grep -F
  - fgrep

Simple grep

```
$ who                          Who is logged on
tolstoy tty1 Feb 26 10:53
tolstoy pts/0 Feb 29 10:59
tolstoy pts/1 Feb 29 10:59
tolstoy pts/2 Feb 29 11:00
tolstoy pts/3 Feb 29 11:00
tolstoy pts/4 Feb 29 11:00
austen pts/5 Feb 29 15:39 (mansfield-park.example.com)
austen pts/6 Feb 29 15:39 (mansfield-park.example.com)

$ who | grep -F austen      Where is austen logged on?
austen pts/5 Feb 29 15:39 (mansfield-park.example.com)
austen pts/6 Feb 29 15:39 (mansfield-park.example.com)
```

Regular Expressions

- Notation that lets you search for text that fits a particular criterion, such as “starts with the letter a”
- Comes in two main flavors (in linux):
  - Basic Regular Expressions (BRE)
  - Extended Regular Expressions (ERE)
- Try http://regexpal.com to test your regex
- Simple regex tutorial: https://www.icewarp.com/support/online_help/203030104.htm

Regular expressions

Character	BRE / ERE	Meaning in a pattern
\	Both	Usually, turn off the special meaning of the following character. Occasionally, enable a special meaning for the following character, such as for \(...\) and \{...\}.
.	Both	Match any single character except NUL. Individual programs may also disallow matching newline.
*	Both	Match any number (or none) of the single character that immediately precedes it. For EREs, the preceding character can instead be a regular expression. For example, since . (dot) means any character, **.*** means "match any number of any character." For BREs, * is not special if it's the first character of a regular expression.
^	Both	Match the following regular expression at the beginning of the line or string. BRE: special only at the beginning of a regular expression. ERE: special everywhere.

Regular Expressions (cont'd)

$	Both	Match the preceding regular expression at the end of the line or string. BRE: special only at the end of a regular expression. ERE: special everywhere.
[...]	Both	Termed a bracket expression, this matches any one of the enclosed characters. A hyphen (-) indicates a range of consecutive characters. (Caution: ranges are locale-sensitive, and thus not portable.) A circumflex (^) as the first character in the brackets reverses the sense: it matches any one character not in the list. A hyphen or close bracket (]) as the first character is treated as a member of the list. All other metacharacters are treated as members of the list (i.e., literally). Bracket expressions may contain collating symbols, equivalence classes, and character classes (described shortly).
\{*n*,*m*\}	BRE	Termed an *interval expression*, this matches a range of occurrences of the single character that immediately precedes it. \{*n*\} matches exactly n occurrences, \{*n*,\} matches at least n occurrences, and \{*n*,*m*\} matches any number of occurrences between n and m. n and m must be between 0 and RE_DUP_MAX (minimum value: 255), inclusive.
\(\)	BRE	Save the pattern enclosed between \(and \) in a special *holding space*. Up to nine subpatterns can be saved on a single pattern. The text matched by the subpatterns can be reused later in the same pattern, by the escape sequences \1 to \9. For example, **\(ab\).*\1** matches two occurrences of ab, with any number of characters in between.

Regular Expressions (cont'd)

\n	BRE	Replay the nth subpattern enclosed in \(and \) into the pattern at this point. n is a number from 1 to 9, with 1 starting on the left.
{n,m}	ERE	Just like the BRE \{n,m\} earlier, but without the backslashes in front of the braces.
+	ERE	Match one or more instances of the preceding regular expression.
?	ERE	Match zero or one instances of the preceding regular expression.
|	ERE	Match the regular expression specified before or after.
( )	ERE	Apply a match to the enclosed group of regular expressions.

Examples

Expression	Matches
tolstoy	The seven letters tolstoy, anywhere on a line
^tolstoy	The seven letters tolstoy, at the beginning of a line
tolstoy$	The seven letters tolstoy, at the end of a line
^tolstoy$	A line containing exactly the seven letters tolstoy, and nothing else
[Tt]olstoy	Either the seven letters Tolstoy, or the seven letters tolstoy, anywhere on a line
tol.toy	The three letters tol, any character, and the three letters toy, anywhere on a line
tol.*toy	The three letters tol, any sequence of zero or more characters, and the three letters toy, anywhere on a line (e.g., toltoy, tolstoy, tolWHOtoy, and so on)

POSIX Bracket Expressions

Class	**Matching characters**	**Class**	**Matching characters**
[:alnum:]	Alphanumeric characters	[:lower:]	Lowercase characters
[:alpha:]	Alphabetic characters	[:print:]	Printable characters
[:blank:]	Space and tab characters	[:punct:]	Punctuation characters
[:cntrl:]	Control characters	[:space:]	Whitespace characters
[:digit:]	Numeric characters	[:upper:]	Uppercase characters
[:graph:]	Nonspace characters	[:xdigit:]	Hexadecimal digits

Backreferences

- Match whatever an earlier part of the regular expression matched
  - Enclose a subexpression with \(and \).
  - There may be up to 9 enclosed subexpressions and may be nested
  - Use \digit, where digit is a number between 1 and 9, in a later part of the same pattern.

Pattern	**Matches**
\(ab\)\(cd\)[def]*\2\1	abcdcdab, abcdeeecdab, abcdddeeffcdab, ...
\(why\).*\1	A line with two occurrences of why
\([[:alpha:]_][[:alnum:]_]*\) = \1;	Simple C/C++ assignment statement

Matching Multiple Characters with One Expression

*	Match zero or more of the preceding character
\{*n*\}	Exactly n occurrences of the preceding regular expression
\{*n*,\}	At least n occurrences of the preceding regular expression
\{*n*,*m*\}	Between n and m occurrences of the preceding regular expression

Anchoring text matches

Pattern	Text matched (in bold) / Reason match fails
ABC	Characters 4, 5, and 6, in the middle: abc**ABC**defDEF
^ABC	Match is restricted to beginning of string
def	Characters 7, 8, and 9, in the middle: abcABC**def**DEF
def$	Match is restricted to end of string
[[:upper:]]\{3\}	Characters 4, 5, and 6, in the middle: abc**ABC**defDEF
[[:upper:]]\{3\}$	Characters 10, 11, and 12, at the end: abcDEFdef**DEF**
^[[:alpha:]]\{3\}	Characters 1, 2, and 3, at the beginning: **abc**ABCdefDEF

Operator Precedence (High to Low)

Operator	Meaning
[. .] [= =] [: :]	Bracket symbols for character collation
metacharacter	Escaped metacharacters
[ ]	Bracket expressions
\(\) *digit*	Subexpressions and backreferences
* \{ \}	Repetition of the preceding single-character regular expression
no symbol	Concatenation
^ $	Anchors

sed

- Now you can extract, but what if you want to replace parts of text?
- Use sed!

```
sed 's/regExpr/replText/'
```

- Example

```
sed 's/:.*//' /etc/passwd  # Remove everything
                           # after the first colon
```

Text Processing Tools

- sort: sorts text
- wc: outputs a one-line report of lines, words, and bytes
- lpr: sends files to print queue
- head: extract top of files
- tail: extracts bottom of files

The Shell and OS

The Shell and OS

- The shell is the user's interface to the OS
- From it you run programs.
- Common shells
  - bash, zsh, csh, sh, tcsh
- Allow more complex functionality then interacting with OS directly
  - Tab complete, easy redirection

Scripting Languages Versus Compiled Languages

- Compiled Languages
  - Ex: C/C++, Java
  - Programs are translated from their original source code into object code that is executed by hardware
  - Efficient
  - Work at low level, dealing with bytes, integers, floating points, etc
- Scripting languages
  - Interpreted by program
  - Interpreter reads script code, translates it into internal form, and execute programs

Why Use a Shell Script?

- Simplicity
- Portability
- Ease of development

Example

```
$ who
george       pts/2    Dec 31 16:39 (valley-forge.example.com)
betsy        pts/3    Dec 27 11:07 (flags-r-us.example.com)
benjamin     dtlocal  Dec 27 17:55 (kites.example.com)
jhancock     pts/5    Dec 27 17:55 (:32)
Camus        pts/6    Dec 31 16:22
tolstoy      pts/14   Jan 2 06:42
```

```
$ who | wc -l            Count users
6
```

```
$ who | grep littenek    Where is littenek?
6
```

Idea

- Build a script that searches for a name
  - i.e. $who | grep userWeAreLookingFor
- Check if userWeAreLookingFor is logged in
- Let's create it!
  - create a file called `finduser`

finduser

Script:

```
#! /bin/sh
# finduser --- see named by first arguement is
  logged in
who | grep $1
```

Run it:

```
$ chmod +x finduser        Make it executable

$ ./finduser littenek
```

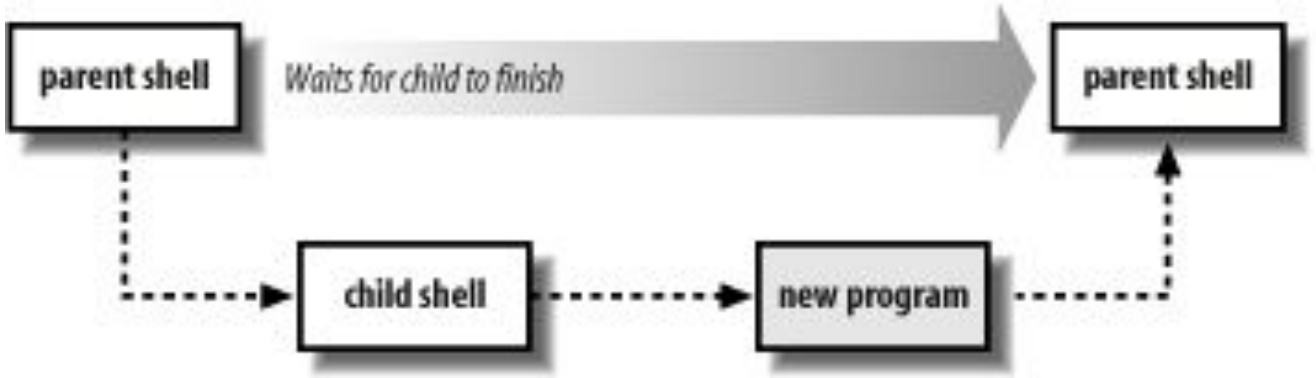
The #! First Line

- A shell script is just a file with shell commands.
- When the shell runs a program (e.g finduser), it asks the kernel to start a new “child process” and run the given program in that process.
- First line is used to state which “child shell” to use:

  #! /bin/csh –f

  #! /bin/awk –f

  #! /bin/sh



Ubuntu Shell Scripting

- Ubuntu 6.01+ uses by default “dash” shell which is POSIX compliant
- /bin/sh isa link to /bin/dash
- “dash” and “bash” should not have any differences in use
- Bash tutorial
  - http://linuxconfig.org/bash-scripting-tutorial

Variables

- Start with a letter or underscore and may contain any number of following letters, digits, or underscores
- Declared using =
  - `Var = 'helloworld'`
- Referenced with $
  - `echo $Var`
- Reminder - echo prints to screen
  - `man echo`
  - optional: `man printf`
    - For fancier output

Adding Variables to script files

```
#! /bin/sh
STRING=”HELLO WORLD”    #assign variable
echo $STRING            #prints the value
```

Accessing Shell Script Arguments

- Positional parameters represent a shell script's command line arguments
- For historical reasons, enclose the number in braces if greater than 9

```
#! /bin/sh
#test script
echo first arg is $1
echo tenth arg is ${10}

> ./argtest 1 2 3 4 5 6 7 8 9 10
```

If statements

- If statements use the test command or []
- man test
  - to see the expressions that you can create
  - e.g:

```
#!/bin/bash
if test "$#" -ne 2; then    #if number of args not equal to 2 then...
    echo "Illegal number of parameters"
else
    if [ $1 -gt $2 ]; then  #if arg $1  >= arg $2 ...
        echo "1st argument is greater than 2nd"
    else
        echo "not possible"
    fi
fi
```

If statements

```
if condition
then
     statements-if-true-1
[ elif condition
then
     statements-if-true-2
... ]
[ else
   statements-if-all-else-fails ]
fi
```

Example

```
if grep pattern myfile > /dev/null
then
   ... Pattern is there
else
   ... Pattern is not there
fi
```

case Statement

```
case $1 in
-f)
    ... Code for -f option
    ;;
-d | --directory) # long option allowed
    ... Code for -d option
    ;;
*)
    echo $1: unknown option >&2
    exit 1 # ;; is good form before `esac', but not
   required
esac
```

for Loops

Generally follows form of foreach loop, for example:

```
for i in atlbrochure*.xml
do
    echo $i
    mv $i $i.old
done
```

while and until loops

Standard syntax for while loops:

```
while condition
do
   statements
done
```

Also supports negation of condition:

```
until condition
do
   statements
done
```

break and continue

- Pretty much the same as in C/C++

Functions

- Semantically, calling a function is very similar to invoking another bash script.
- Must be defined before they can be used
- Can be done either at the top of a script or by having them in a separate file and source them with the “dot” (.) command.

Example

```
wait_for ( ) {
    until who | grep "$1" > /dev/null
    do
        sleep ${2:-30}
    done
}
```

Functions are invoked the same way a command is:

```
wait_for tolstoy    # Wait for tolstoy, check every 30s
wait_for tolstoy 60 # Wait for tolstoy, check every 60s
```

Accessing Arguments

- Positional parameters represent a shell script's command-line arguments, or arguments to a function.
- For historical reasons, enclose the number in curly braces if it's greater than 9.

```
echo first arg is $1
echo tenth arg is ${10}
```

Function Return

The return command serves the same function as exit and works the same way:

```
answer_the_question ( ) {
    ...
    return 42
}
```

Exit: Return value

Check exit status of last command that ran with `echo $?`

Value	Meaning
0	Command exited successfully
>0	Failure during redirection
1-125	Command exited unsuccessfully. The meanings
126	Command found, but file was not executable
127	Command not found
>128	Command died due to receiving a signal

Quotes

Preface with: `world = 42`

- Three kinds of quotes
  - Backticks: ``
    - `echo \`ls $world\` -> <result of ls 42>`
    - Same as: `echo $(ls $world)`
  - Double quotes: “”
    - `echo “ls $world” -> ls 42`
  - Single quotes: ‘’
    - `echo ‘ls $world’ -> ls $world`

Basic Command Searching

- $PATH variable is a list of directories in which commands are found

```
$ echo $PATH
/bin:/usr/bin:/usr/X11R6/bin:/usr/local/bin
```

Simple Execution Tracing

- To get shell to print out each command as it's execute, precede it with "+"
- You can turn execution tracing within a script by using:

  `set -x`: to turn it on

  `set +x`: to turn it off

POSIX Built-in Shell Variables

Variable	Meaning
#	Number of arguments given to current process.
@	Command-line arguments to current process. Inside double quotes, expands to individual arguments.
*	Command-line arguments to current process. Inside double quotes, expands to a single argument.
- (hyphen)	Options given to shell on invocation.
?	Exit status of previous command.
$	Process ID of shell process.
0 (zero)	The name of the shell program.
!	Process ID of last background command. Use this to save process ID numbers for later use with the *wait* command.
ENV	Used only by interactive shells upon invocation; the value of $ENV is parameter-expanded. The result should be a full pathname for a file to be read and executed at startup. This is an XSI requirement.
HOME	Home (login) directory.
IFS	Internal field separator; i.e., the list of characters that act as word separators. Normally set to space, tab, and newline.
LANG	Default name of current locale; overridden by the other LC_* variables.
LC_ALL	Name of current locale; overrides LANG and the other LC_* variables.
LC_COLLATE	Name of current locale for character collation (sorting) purposes.
LC_CTYPE	Name of current locale for character class determination during pattern matching.
LC_MESSAGES	Name of current language for output messages.
LINENO	Line number in script or function of the line that just ran.
NLSPATH	The location of message catalogs for messages in the language given by $LC_MESSAGES (XSI).
PATH	Search path for commands.
PPID	Process ID of parent process.
PS1	Primary command prompt string. Default is "$ ".
PS2	Prompt string for line continuations. Default is "> ".
PS4	Prompt string for execution tracing with set -x. Default is "+ ".
PWD	Current working directory.

Arithmetic Operators

Operator	Meaning	Associativity
++ --	Increment and decrement, prefix and postfix	Left to right
+ - ! ~	Unary plus and minus; logical and bitwise negation	Right to left
* / %	Multiplication, division, and remainder	Left to right
+ -	Addition and subtraction	Left to right
<< >>	Bit-shift left and right	Left to right
< <= > >=	Comparisons	Left to right
= = !=	Equal and not equal	Left to right
&	Bitwise AND	Left to right
^	Bitwise Exclusive OR	Left to right
|	Bitwise OR	Left to right
&&	Logical AND (short-circuit)	Left to right
||	Logical OR (short-circuit)	Left to right
?:	Conditional expression	Right to left
= += -= *= /= %= &= ^= <<= >>= |=	Assign ment opera tor s	Right to left

Exit: Return value

Value	Meaning
0	Command exited successfully.
> 0	Failure during redirection or word expansion (tilde, variable, command, and arithmetic expansions, as well as word splitting).
1-125	Command exited unsuccessfully. The meanings of particular exit values are defined by each individual command.
126	Command found, but file was not executable.
127	Command not found.
> 128	Command died due to receiving a signal.

More on Variables

- Read only command

```
hours_per_day=24 seconds_per_hour=3600 days_per_week=7      Assign values
readonly hours_per_day seconds_per_hour days_per_week   Make read-only
```

- Export: puts variables into the environment, which is a list of name-value pairs that is available to every running program

```
PATH=$PATH:/usr/local/bin      Update PATH
export PATH                    Export it
```

- env: used to remove variables from a program's environment or temporarily change environment variable values
- unset: remove variable and functions from the current shell

Parameter Expansion

- Process by which the shell provides the value of a variable for use in the program

```
reminder="Time to go to the dentist!" Save value in reminder
sleep 120                                  Wait two minutes
echo $reminder                            Print message
```

Pattern–matching operators

path=/home/tolstoy/mem/long.file.name

Operator	Substitution
${*variable#pattern*}	If the pattern matches the beginning of the variable's value, delete the shortest part that matches and return the rest.
Example: ${path#/*/}	Result: tolstoy/mem/long.file.name
${*variable##pattern*}	If the pattern matches the beginning of the variable's value, delete the longest part that matches and return the rest.
Example: ${path##/*/}	Result: long.file.name
${*variable%pattern*}	If the pattern matches the end of the variable's value, delete the shortest part that matches and return the rest.
Example: ${path%.*}	Result: /home/tolstoy/mem/long.file
${*variable%%pattern*}	If the pattern matches the end of the variable's value, delete the longest part that matches and return the rest.
Example: ${path%%.*}	Result: /home/tolstoy/mem/long

String Manipulation

- ${string:position}: Extracts substring from $string at $position
- ${string:position:length} Extracts $length characters of substring $string at $position
- ${#string}: Returns the length of $string

POSIX Built-in Shell Variables

Variable	Meaning
#	Number of arguments given to current process.
@	Command-line arguments to current process. Inside double quotes, expands to individual arguments.
*	Command-line arguments to current process. Inside double quotes, expands to a single argument.
- (hyphen)	Options given to shell on invocation.
?	Exit status of previous command.
$	Process ID of shell process.
0 (zero)	The name of the shell program.
!	Process ID of last background command. Use this to save process ID numbers for later use with the *wait* command.
ENV	Used only by interactive shells upon invocation; the value of $ENV is parameter-expanded. The result should be a full pathname for a file to be read and executed at startup. This is an XSI requirement.
HOME	Home (login) directory.
IFS	Internal field separator; i.e., the list of characters that act as word separators. Normally set to space, tab, and newline.
LANG	Default name of current locale; overridden by the other LC_* variables.
LC_ALL	Name of current locale; overrides LANG and the other LC_* variables.
LC_COLLATE	Name of current locale for character collation (sorting) purposes.
LC_CTYPE	Name of current locale for character class determination during pattern matching.
LC_MESSAGES	Name of current language for output messages.
LINENO	Line number in script or function of the line that just ran.
NLSPATH	The location of message catalogs for messages in the language given by $LC_MESSAGES (XSI).
PATH	Search path for commands.
PPID	Process ID of parent process.
PS1	Primary command prompt string. Default is "$ ".

$IFS (Internal Field Seperator)

- This variable determines how Bash recognizes fields, or word boundaries, when it interprets character strings.
- $IFS defaults to whitespace (space, tab, and newline), but may be changed
- **echo "$IFS"** (With $IFS set to default, a blank line displays.)
- More details:
  - http://tldp.org/LDP/abs/html/internalvariables.html
